High-speed Internet access is
now available in Princeton!

The Princeton Municipal Light Department (PMLD) installed a high-speed wireless Internet access network to provide reliable, secure, and cost effective Internet access in our community.

Our wireless network is based on distributing high-speed Internet access on pole top antennas installed throughout town. Pole top antennas will be installed on approximately 20-30 utility poles in order to provide 100% coverage in Princeton. These utility poles are taller than regular utility poles and are necessary to allow our **wireless Internet signal** to penetrate foliage and reach each customer.

Basic residential high-speed Internet access will cost \$39.95 per month for Internet access speeds up to 1.0Mbps. This level of service is **nearly twice as fast as DSL** and **20 times faster than dial-up** connections. Faster access speeds, static IP addresses, and other

levels of service are available for businesses and customers requiring greater bandwidth speeds. PMLD is offering this type of service at **competitive rates** with service features that significantly differentiate it from DSL and other offerings.

The installation of the Internet access equipment is similar to a satellite dish installation (such as DIRECTV). An antenna is installed outside, preferably on the roof, pointing toward one of our wireless antenna outfitted utility poles. The antenna is connected via coax cable to a radio modem that can be either directly connected to your computer via Ethernet cable or connected to a wireless router for use within your home or business. If you need installation assistance, PMLD can refer you to a qualified, local telecommunications contractor.
